Project 2: Simple Backend with Node + Express + Mongo + HTML5
Author: Milena Perez-Gerus
Date: October 19, 2026
Course: CS5610 - Web Development

Project Description
Shot Lists is Milena's half of PhotoFind, a web application for organizing, finding, and planning photos. PhotoFind has two independent features, each with its own MongoDB collection:

1. Images and Search (Rishabh Kumar): add images, tag them, and search for them.
2. Shot Lists (Milena Perez-Gerus): plan the shots for a trip and track your progress.

People often have photo ideas for a trip but forget them in the moment. Shot Lists turns those ideas into a checklist. Users create a list with a name, location, dates, and the shots they want, then check shots off during the trip and watch a progress bar fill. Lists can be filtered by status (all, upcoming, in progress, completed), edited, and deleted, and a statistics section shows progress across all lists.

The shotLists collection holds over 1,000 records. The two features use separate collections, so neither depends on the other.

User Personas

Persona 1: Amy the Weekend Traveler
- **Background**: A teacher who travels most weekends and comes home with hundreds of new photos.
- **Goals**: Capture the few photos she really wishes to take on each trip, e.g. a historic monument.
- **Pain Points**: Realizing post-trip that she missed a shot she wanted to take, and she doesn't plan to travel back.
- **Behavior**: Plans trips weeks in advance and checks her phone between activities while traveling.

Persona 2: Leo the Graduate Student
- **Background:** An environmental science student who takes field photos for his research reports.
- **Goals:** Leave every field trip with all the required photos of sites, conditions, and samples.
- **Pain points:** Field notes scattered across his phone and notebook so he loses track of what is still required.
- **Behavior:** Plans each field day around a checklist. He updates the checklist as his project changes.

User stories

User Story 1: Amy plans a weekend in Boston
As Amy, I want to create a shot list for a trip with a name, location, dates, and the shots I want to take, so I don't miss anything important.

A week before her Boston weekend Amy opens PhotoFind and clicks "+ New shot list." She names it "Boston Weekend," adds Boston and her dates, and types five shots, one per line: Charles River, MIT campus, Northeastern University campus, a moody bar, and her friend's apartment. She clicks Save, and the new list appears at the top with a green confirmation message.

User Story 2: Leo checks off shots in the field
As Leo, I want to check off shots as I take them and see my progress, so I know what I still need for my report.

On his Charles River field day, Leo opens his shot list on his phone. Each time he captures a photo of a site, he ticks its box, and the progress bar fills. Before heading home he sees "3/5" and two unchecked shots, so he walks back to capture the last two sites instead of discovering the missing shots later.

User Story 3: Amy finds her next trip
As Amy, I want to filter my shot lists by status (upcoming, in progress, completed), so I can find the one I need.

Amy has many lists from past trips. She clicks "Upcoming," and only trips that haven't yet started appear, three per page. She finds her ski trip on the first page without scrolling through old completed lists.

User Story 4: Leo updates his plans
As Leo, I want to edit or delete a shot list, so it stays up to date as my plans change.

Leo's advisor moves his field day by a week. He opens the list, clicks Edit, and changes the dates. Later, a site is dropped from the project entirely, so he deletes an old list he no longer needs, confirming the popup so nothing is deleted by accident.

User Story 5: Amy reviews her progress
As Amy, I want to see statistics across my shot lists, like completion rate, so I can see how well I stick to my plans.

At the end of the season Amy scrolls to the Statistics section. She sees how many lists she made, how many shots she planned and captured, and her overall completion rate. It shows her she usually finishes most of her lists, which motivates her to keep planning.
